Problem 1 (Properties of the Continuous Fourier Transform)

(a) Linearity: $\mathcal{F}[a f(x) + b g(x)](u) = \langle a f(x) + b g(x), b_u \rangle$

$$= \int_{-\infty}^{+\infty} (a f(x) + b g(x)) e^{-i 2 \pi u x} dx$$

factor rule
& sum rule

$$= a \cdot \int_{-\infty}^{+\infty} f(x) e^{-i 2 \pi u x} dx + b \cdot \int_{-\infty}^{+\infty} g(x) e^{-i 2 \pi u x} dx$$
$$= a \cdot \langle f, b_u \rangle + b \cdot \langle g, b_u \rangle$$
$$= a \cdot \mathcal{F}[f](u) + b \cdot \mathcal{F}[g](u) \quad \square$$

(b) Spatial Shift: $\mathcal{F}[f(x-a)](u) = \langle f(x-a), b_u \rangle$

$$= \int_{-\infty}^{+\infty} f(x-a) e^{-i 2 \pi u x} dx$$

$z = x - a$
 $\rightarrow x = z + a$

$$= \int_{-\infty}^{+\infty} f(z) e^{-i 2 \pi u (z+a)} dz$$
$$= \int_{-\infty}^{+\infty} f(z) e^{-i 2 \pi u z + i 2 \pi u a} dz$$
$$= \int_{-\infty}^{+\infty} f(z) e^{-i 2 \pi u z} \cdot \underbrace{e^{i 2 \pi u a}}_{\text{constant}} dz$$

factor rule

$$= e^{i 2 \pi u a} \int_{-\infty}^{+\infty} f(z) e^{-i 2 \pi u z} dz$$
$$= e^{i 2 \pi u a} \cdot \langle f, b_u \rangle = e^{i 2 \pi u a} \mathcal{F}[f](u) \quad \square$$

(c) Frequency Shift: $\mathcal{F}[f(x) \cdot e^{-i 2 \pi u_0 x}](u) = \langle f(x) \cdot e^{-i 2 \pi u_0 x}, b_u \rangle$

$$= \int_{-\infty}^{+\infty} f(x) e^{-i 2 \pi u_0 x} e^{-i 2 \pi u x} dx$$
$$= \int_{-\infty}^{+\infty} f(x) e^{-i 2 \pi x (u_0 + u)} dx$$
$$= \langle f, b_{u_0+u} \rangle$$
$$= \mathcal{F}[f](u_0 + u) \quad \square$$

(d) Scaling: $\mathcal{F}[f(ax)](u) = \langle f(ax), b_u \rangle$

$$\begin{aligned}
 &= \int_{-\infty}^{+\infty} f(ax) e^{-i2\pi ux} dx \\
 &\xrightarrow{\substack{z=ax \\ \rightarrow x=\frac{z}{a}}} = \int_{-\infty}^{+\infty} f(z) e^{-i2\pi u \frac{z}{a}} \frac{1}{|a|} dz \\
 &\text{factor rule} = \frac{1}{|a|} \int_{-\infty}^{+\infty} f(z) e^{-i2\pi u \frac{z}{a}} dz \quad \text{to make up for the flip of the integration limit, if } a \text{ is negative} \\
 &= \frac{1}{|a|} \langle f, b_{\frac{u}{a}} \rangle = \frac{1}{|a|} \mathcal{F}[f]\left(\frac{u}{a}\right)
 \end{aligned}$$

(e) Convolution: $\mathcal{F}[(f * g)(x)](u) = \langle (f * g)(x), b_u \rangle$

Convolution is defined as:

$$\begin{aligned}
 (f * g)(x) &:= \int_{-\infty}^{+\infty} f(x') g(x - x') dx' \\
 &= \int_{-\infty}^{+\infty} \left(\int_{-\infty}^{+\infty} f(x') g(x - x') dx' \right) e^{-i2\pi ux} dx \\
 &\xrightarrow{\text{change order of integration}} = \int_{-\infty}^{+\infty} \int_{-\infty}^{+\infty} f(x') g(x - x') e^{-i2\pi ux} dx dx' \\
 &= \int_{-\infty}^{+\infty} f(x') \left(\int_{-\infty}^{+\infty} g(x - x') e^{-i2\pi ux} dx \right) dx' \\
 &\quad \text{Spatial Shift Property} \quad \downarrow \quad \mathcal{F}[g(x - x')](u) \\
 &= \int_{-\infty}^{+\infty} f(x') e^{i2\pi ux'} dx' \mathcal{F}[g](u) \\
 &= \langle f, b_u \rangle \mathcal{F}[g](u) = \mathcal{F}[f](u) \mathcal{F}[g](u) \quad \square
 \end{aligned}$$

(f) Differentiation:

$$\begin{aligned}
 f'(x) &= \frac{df(x)}{dx} \stackrel{\text{inverse F.T.}}{=} \frac{d \mathcal{F}^{-1}[\hat{f}]}{dx} = \frac{d}{dx} \int_{-\infty}^{+\infty} \hat{f}(u) e^{i2\pi ux} du \\
 &= \int_{-\infty}^{+\infty} i2\pi u \hat{f}(u) e^{i2\pi ux} du = i2\pi u \int_{-\infty}^{+\infty} \hat{f}(u) e^{i2\pi ux} du \\
 &\stackrel{\text{Linearity}}{=} \mathcal{F}^{-1}[i2\pi u \cdot \mathcal{F}[f](u)] \quad \text{[yellow box]} \quad \mathcal{F}^{-1}[\mathcal{F}[f](u)] \\
 \Rightarrow \mathcal{F}[f'](u) &= \mathcal{F}[\mathcal{F}^{-1}[i2\pi u \cdot \mathcal{F}[f](u)]] = i2\pi u \cdot \mathcal{F}[f](u) \quad \square
 \end{aligned}$$

27
→

Continuous
Given,

Fairier Transforms

$$f(x) = \begin{cases} 0, & (x \leq -3) \\ \frac{x^2 + 6x + 9}{16}, & (-3 < x \leq -1), \\ \frac{6 - 2x^2}{16}, & (-1 < x \leq 1), \\ \frac{x^2 - 6x + 9}{16}, & (1 < x \leq 3), \\ 0, & (x > 3) \end{cases}$$

Solution :

$$f(x) = h(x) * h(x) * h(x)$$

WKT,

$$h(x) = \begin{cases} 1/2, & (-1 \leq x \leq 1) \\ 0, & \text{other} \end{cases}$$

$$\hat{f}(u) = \int_{-\infty}^{\infty} h(x) \cdot e^{-2\pi i u x} \cdot dx$$

$$= \int_{-1}^1 \frac{1}{2} \cdot e^{-2\pi i u x} \cdot dx$$

$$= \frac{-1}{4i\pi u} \cdot e^{-2\pi i u x} \Big|_{-1}^1$$

$$= \frac{-1}{4i\pi u} \cdot (e^{-2\pi i u} - e^{2\pi i u}) \quad [\text{Rearrange}]$$

$$= \frac{1}{2\pi u} \cdot \left(\frac{e^{2\pi i u} - e^{-2\pi i u}}{2i} \right)$$

$$= \frac{1}{2\pi u} \cdot \sin(2\pi u)$$

Using convolution property
of Fourier transforms

$$\therefore \hat{f}(u) = \frac{\sin^3 2\pi u}{8\pi^3 u^3}$$

5/6

3] Symmetry and Anti-Symmetry of Fourier Transforms:
 → (a) Given, f : 1-D real signal

Show that, $\hat{f}(u) = \mathcal{F}[f]$ has both real & imaginary parts
 WKT, we can write the above expression as

$$= \int_{-\infty}^{\infty} f(x) \cdot e^{-i2\pi ux} \cdot dx \quad \text{--- (1)}$$

Now, let's use the hint

i.e. Using Euler's Rule: $e^{i\phi} = \cos\phi + i\sin\phi \quad \text{--- (2)}$

Let $\phi = -2\pi ux$

Then (1) becomes

$$e^{i(-2\pi ux)} = \cos(-2\pi ux) + i\sin(-2\pi ux)$$

Using this eqn (2)

$$\text{i.e. } \hat{f}(u) = \int_{-\infty}^{\infty} f(x) \cdot \underbrace{[\cos(-2\pi ux)]}_{\text{real}} + i \underbrace{[\sin(-2\pi ux)]}_{\text{imaginary}} \cdot dx$$

splitting the expression

$$\text{i.e. } \hat{f}(u) = \int_{-\infty}^{\infty} f(x) \cdot \cos(-2\pi ux) \cdot dx + i \int_{-\infty}^{\infty} f(x) \cdot \sin(-2\pi ux) \cdot dx$$

Thus, Using Euler's formula we can write as.

• Real: $\hat{f}(u) = \int_{-\infty}^{\infty} f(x) \cdot \cos(-2\pi ux) \cdot dx$ ✓

• Imaginary: $\hat{f}(u) = \int_{-\infty}^{\infty} f(x) \cdot \sin(-2\pi ux) \cdot dx$ ✓

(P.T.O)

Now, to show that FT is symmetric ^(Real) around origin, let us take $u = -u$.
i.e. the function is symmetric along both the axis.

$$\begin{aligned}\Rightarrow \text{Real} [\hat{f}(-u)] &= F[f](u) \\ &= \int_{-\infty}^{\infty} f(x) \cdot \cos(-2\pi(-u)x) \cdot dx \\ &= \int_{-\infty}^{\infty} f(x) \cdot \cos(2\pi ux) \cdot dx \\ &= F[f](u) \quad \checkmark\end{aligned}$$

From Euler's we know that,

$$\boxed{\cos \phi = \frac{e^{i\phi} + e^{-i\phi}}{2}} \quad \& \quad \boxed{\phi = 2\pi ux}$$

$$= \int_{-\infty}^{\infty} f(x) \cdot \frac{e^{i2\pi ux} + e^{-i2\pi ux}}{2} \cdot dx$$

[$u \rightarrow -u$]

$$= \int_{-\infty}^{\infty} f(x) \cdot \frac{e^{i2\pi(-u)x} + e^{-i2\pi(-u)x}}{2} \cdot dx$$

$$= \int_{-\infty}^{\infty} f(x) \cdot \frac{e^{-i2\pi ux} + e^{i2\pi ux}}{2} \cdot dx$$

$$\hat{f}(-u) = \int_{-\infty}^{\infty} f(x) \cdot \cos(-2\pi ux) \cdot dx$$

$$\therefore \text{Real} [\hat{f}(u)] \Leftrightarrow \text{Real} [\hat{f}(-u)] \quad \checkmark$$

i.e. For both u & $-u$, it is equal. So real part of the Fourier transform is symmetric!

(P.T.O) ✓

Now, let's show that the imaginary part of the FT is anti-symmetric.

We already know that:

$$\text{Imaginary} [\hat{f}(u)] = \int_{-\infty}^{\infty} f(x) \cdot \sin(-2\pi ux) \cdot dx \quad \text{--- (2)}$$

• Just to prove this, let $u = -u$ in (2)

$$\begin{aligned} \text{Imaginary} [\hat{f}(-u)] &= \int_{-\infty}^{\infty} f(x) \cdot \sin(-2\pi(-u)x) \cdot dx \\ &= \int_{-\infty}^{\infty} f(x) \cdot \sin(2\pi ux) \cdot dx \end{aligned}$$

Again, from Euler's we know that:

$$\sin \phi = \frac{e^{i\phi} - e^{-i\phi}}{2i} \quad \& \quad \phi = 2\pi ux$$

$$= \int_{-\infty}^{\infty} f(x) \cdot \frac{e^{i2\pi ux} - e^{-i2\pi ux}}{2i} \cdot dx$$

$$= \int_{-\infty}^{\infty} f(x) \cdot \frac{e^{-i2\pi ux} - e^{i2\pi ux}}{2i} \cdot dx$$

Take '-' common.

$$= \int_{-\infty}^{\infty} f(x) \cdot (-\sin(-2\pi ux)) \cdot dx$$

$$= - \int_{-\infty}^{\infty} f(x) \cdot \sin(-2\pi ux) \cdot dx$$

$$\therefore \text{Im} [\hat{f}(-u)] \neq \text{Im} [\hat{f}(u)]$$

i.e. Imaginary part of FT is anti-symmetric

⑥ FT decomposes a signal into frequencies.
What's the meaning of a negative freq?
→ WKT,

$$\cos \theta = \frac{e^{i\theta} + e^{-i\theta}}{2} = \underbrace{\frac{e^{i\theta}}{2}}_{\text{'+'ve' freq}} + \underbrace{\frac{e^{-i\theta}}{2}}_{\text{'-'ve' freq}}$$
$$= f(\theta) + f(-\theta)$$

From the above expression it is rather clear that Fourier Transform's basis function is a real-valued sine wave i.e. it generates results in 2 phases, thus we represent it as '++ve' & '-ve' frequency. ✓

[Reference: Lecture 4/slide 23]

There are always 2 equal magnitude complex exponential functions & each of them are rotating in opposite directions. As a result of which, the imaginary parts gets canceled & the real parts are combined. Thus the resultant signal is a pure real sine wave.

Ultimately, when we see this real sine wave, we notice 2 phases: one (+ve) frequency & one (-ve) frequency. ✓
